

# RC Teledata Inventory Module

## GENERAL

The Inventory Module contains information required for invoicing such as commodity names, inventory, minimum inventory, price, and discount rates.

The Inventory Module provides effective aid to improved inventory control. The system will report automatically in the case of understocking of a given commodity. If the inventory is inadequate for the supply of a certain order, information to this effect appears on the screen of the display unit. The module will thus give warning that a shortage of a commodity is developing.

An example could be:

```
INVENTORY LESS THAN MINIMUM
COMM.NO.  INVENTORY  MIN.INVENTORY
45901      14476      14500
```

Likewise a reorder will be printed, to constitute a basis for due submission of such reorders to the supplier.

A great advantage of the system is that several prices may be quoted for each commodity. Information from the customer files will inform the prices to be applied to sales to the individual customers. It will thus be possible to have different prices for different customers, without this involving additional manual work.

The module also includes an inquiry facility by which information on a specific article is easily obtained.

An example could be an inquiry for commodity 3397 A.  
The following command is entered:

```
? I 3397 AP
```

and the system responds:

```
11 10 77 - 13.05
FOR COMM.NO.          3397 A
UNIT PRICES          -
1                      6.25
2                      7.00
3                      7.43
```

At the end of the day a reordering list will be produced.
